Click Image to view full size or this bar to open in a new window. 800x418.

Hang a string from a nail...  
so the string splits the x-ring in half.  
Fire a field point arrow from a distance of 9 feet.

**Step 1:** If the field point misses left  
**move all of your pins to the left.**  
This field point arrow is shot at 3 yards.

**Step 2:** If the field point misses right  
**move all of your pins to the right.**  
This field point arrow is shot at 3 yards.

**Step 3:** Soon, when the pins are in the right spot...  
the field point will hit the string.  
This field point arrow is shot at 3 yards.

**Step 4:** Fire 3 arrow group at 10 yards.  
If the middle of the 3 arrow group misses left...  
move ARROW REST to the RIGHT.

**Step 5:** Fire 3 arrow group at 10 yards.  
If the middle of the 3 arrow group misses right...  
move ARROW REST to the LEFT.

**Step 6:** Soon, 3 arrow group  
is split in half by the string.

**Step 7: NOW. Go Back to 3 yards.**  
Double check with single  
field point arrow.

Adjust d-loop up or down...  
and it may tighten the group.

You might need to make a small  
adjustment to pins (left or right).

Thanks to all! I have enjoyed reading everyone's instructions and interpretations, this has been a great subject to learn from.

Does it matter for walk back tuning if it is done on the shorter distances or if it is done at the longer, say 30,40,50,60 yards? Does it give the same result? I will be working on this over the weekend to get ready for 3d and want to make sure I can get it as good as I can.
